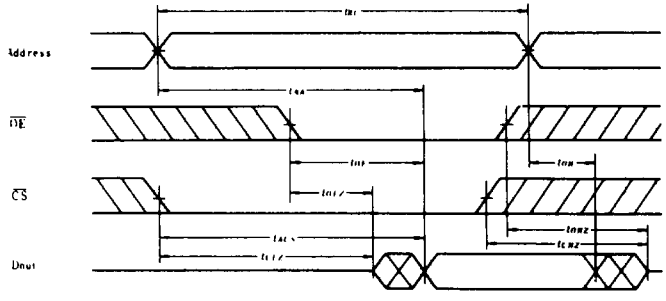
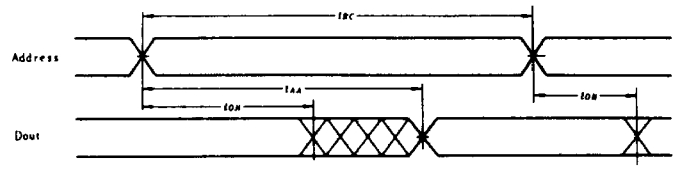
■TIMING WAVEFORM

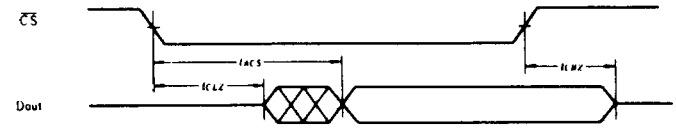
●READ CYCLE (1)[1]



● READ CYCLE (2)[1][2][4]

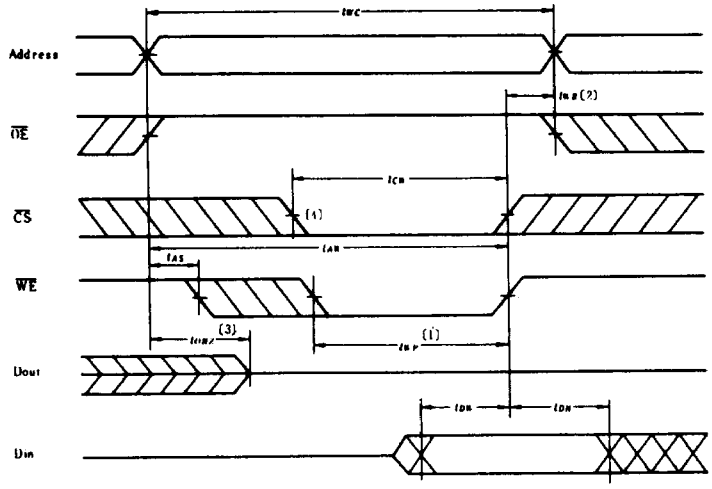


● READ CYCLE (3)[1][3][4]

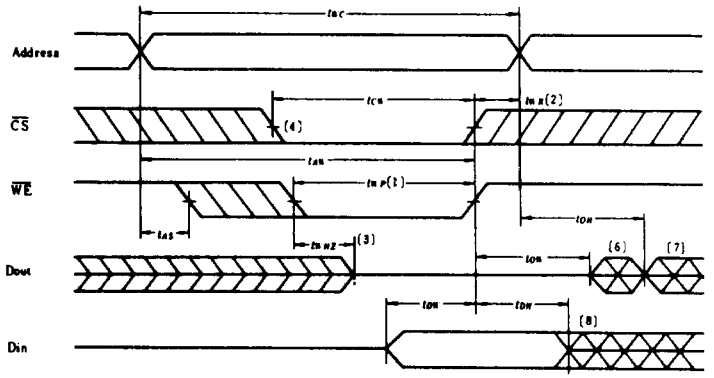


NOTES: 1. $\overline{WE}$ is High for Read Cycle.
2. Device is continuously selected, $\overline{CS}$ = V_{IL}.
3. Address Valid prior to or coincident with $\overline{CS}$ transition Low.
4. $\overline{OE}$ = V_{IL}.

● WRITE CYCLE (1)



●WRITE CYCLE (2)[5]



NOTES:
1. A write occurs during the overlap (t_{WP}) of a low $\overline{CS}$ and a low $\overline{WE}$.
2. t_{WR} is measured from the earlier of $\overline{CS}$ or $\overline{WE}$ going high to the end of write cycle.
3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
4. If the $\overline{CS}$ low transition occurs simultaneously with the $\overline{WE}$ low transitions or after the $\overline{WE}$ transition, output remain in a high impedance state.
5. $\overline{OE}$ is continuously low. ($\overline{OE} = V_{IL}$)
6. D_{out} is the same phase of write data of this write cycle.
7. D_{out} is the read data of next address.
8. If $\overline{CS}$ is Low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
